

CS 410 Project Progress Report  
Kajetan Haas

1) Which tasks have been completed?

- A basic Firefox browser extension has been set up using JavaScript, HTML, and CSS. It includes a search bar to search the page.

2) Which tasks are pending?

- The approximate string matching algorithm needs to be implemented.
- A dataset like WordNet needs to be used to match similar words.
- The results need to be ranked and displayed in the pop up window.

3) Are you facing any challenges?

- Developing a browser extension is more difficult than I anticipated as all the functionality needs to be set up in very specific ways, presumably for security reasons. One of the main difficulties was getting logging to work correctly for debugging, but now that this is resolved everything is much easier.
